ii

Abstract The purpose of this study was to determine if there were differences in the prevalence of risk factors for low back pain between two groups of nurses. One group consisted of nurses who had been employed by the same hospital for at least 10 years and the other group consisted of newly hired nurses. A questionnaire was sent to all nurses in each group asking them to complete it if they had experienced low back pain during the previous year. The results showed that the prevalence of low back pain was higher among the nurses who had been employed for at least 10 years than among the newly hired nurses. This finding suggests that the prevalence of low back pain may increase with length of employment.
